dyeing beck. Obm.tekh.opyt. [MLP] no.36:40-42 '56. (MIRA 11:11)
(Dyes and dyeing--Apparatus)

An improvement of the standard for casein. V. Tata-
 tinov, M. Turok and F. Panova. *Molokno-Maslo*,
Prilozhenie, 1939, No. 1, 21; *Khim. Revist. Zhur.* 1939,
 No. 7, 118. Acid casein should be prepd. only by the re-
 action of fresh residue of the mineral or org. acid; mech.
 admixts. in casein and contamination with microorgan-
 isms should be detd. For the detn. of the contamination
 with microorganisms add 100 cc. of sterilized water at 80°
 to 10 g. of casein in a sterilized flask, keep the temp. at
 30° for 7 hrs., add 5 cc. of a 1:100 soln. of sterilized methyl-
 ene light-blue and observe the change of color after 10
 min. With a Nessler's no. of 10, 10 or 50 the ext. of casein
 remains light blue, at 70 it becomes green, and it becomes
 colorless at higher values of Nessler's no. For 1st-grade

casein Nessler's no. of casein should not be above 30, for
 the 2nd-grade 50 and for the 3rd-grade 70. W. R. Henn

TITLE:

Processing of Polyvinyl Chloride Into Pressure-casting Products

PERIODICAL: Plasticheskiye massy, 1960, No. 6, pp. 26 - 30

TEXT: The authors discuss Western papers on the casting of polyvinyl chloride (PVC) and indicate the difficulties: low thermostability, low heat conductivity, position of the softening point near the decomposition temperature. Fig. 1 shows the diagram of a heating cylinder according to data by G. Wick, H. König (Ref. 1). The authors then report on their experiments carried out at the laboratoriya plastmass i reziny VNII burovoy tekhniki (Laboratory of Plastics and Rubber of the All-Union Scientific Research Institute of Drilling Techniques). Parts of turbine drills and other components used in the drilling technique were cast (Fig. 2). For this purpose, two heating cylinders (No.1 - Fig. 3, No.2 - Fig. 4) were constructed, the data of which are given in Table 1. The heating cylinders were used in a Ziegler casting machine of the

B004/B054

type LM-7cd (LM-7sb). The following differences between the two cylinders are indicated: cylinder No.1: volume 80 cm^3 , smallest clearance between cylinder wall and torpedo 4 mm, maximum pressure on the plunger 2000 kg/cm^2 ; cylinder No.2: volume 120 cm^3 , clearance 6 mm, maximum pressure 1350 kg/cm^2 . The substances cast were emulsion-PVC of the type PF-4 (PF-4), and the composition of the type УПМ-2 (UPI-2) (Table 2). Lead silicate was used as stabilizer. By means of cylinder No.2 it was only possible to cast a PVC plasticized by 10% of dibutyl phthalate at a cylinder temperature of 170°C . Table 3 compares the mechanical characteristics of these castings with such of vinylplast of the type TY 3823-53 (TU 3823-53). By means of cylinder No.1 it was possible to cast non-plasticized PVC at temperatures of $160-165^\circ\text{C}$. The smaller clearance effected higher friction and, thus, an additional temperature increase in the mass itself. For better plastification, a metal mesh was introduced in the nozzle. Better results, however, were attained with a valve shown in Fig. 5. The authors mention papers by E. I. Barg (Ref. 4) and V. A. Kargin, T. A. Sogolova (Ref. 5). There are 5 figures, 3 tables, and 7 references: 2 Soviet, 3 US, 1 British, and 1 German.

Title : The combined effect of additives during the electrolysis of zinc sulfate solutions

Periodical : Zhur. prikl. khim., 28, 5, 467-474, 1955

Abstract : Various additives were added to the standard electrolyte containing 60 g Zn and 100 g H₂SO₄ per liter. The effect of a single additive and the combined effect of two additives on the current efficiency of hydrogen were studied and the data compiled in tables. The sum of the added effects of two additives may be higher or lower than the combined effect of the mixture. The positive difference was compared with promoter action, and the negative difference with catalytic poisoning. Three tables, 9 references, all Russian (1945-1955).

TITLE: Optimum forged rings manufacturing technique

SOURCE: Hutnické listy, no. 1, 1966, 16-23

TOPIC TAGS: metal forging, metallurgic industry

ABSTRACT: The manufacture of rings by the mandrel forging technique is discussed. The optimum forging reduction degree is a product of partial reduction degrees resulting from the stages of: forging of the billet, forging of the disk, and the mandrel forging process. An equation for the optimum diameter of the original billet is derived. It states that this diameter equals the cube root of the product of a coefficient and of the weight of the forging billet divided by the product of the wall thickness of the ring and its height. Methods for calculation of the constant are given. Orig. art. has: 3 figures, 24 formulas and 6 tables. [Based on author's

"Testing of the Mechanics of Respiration in Cases of Silicosis."

Budapest, Orvosi Hetilap, Vol 104, No 45, 10 Nov 63, pages 2126-2129.

Abstract: [Authors' Hungarian summary] Results of respiration mechanical and spirometric testing on 110 cases are reported. Of the patients tested, 75 suffered from silicosis in its various radiological stages, where the silicosis was complicated by bronchitis, the compliance values showed a definite decrease. A definite compliance decrease was also found in about half of the silicosis cases, where the disease was more severe than the P₃ radiological stage, but clinical bronchitis was absent. The possible causes, the indications for the test and the evaluation of the results are also discussed. 2 Hungarian, 5 Western references.

TITLE:

Thermal stability and corrosive activity of sulfur-containing
fuels at elevated temperatures

PERIODICAL:

Referativnyi zhurnal. Khimiya, no. 3, 1962, 489, abstract
3M193 (Sb. "Khimiya svergaorgan. soyedineniy, soderzhashchikh
v neftyakh i nefteproduktakh. v. 4"., M., Gostoptekhnizdat,
1961, 231 - 235)

TEXT: The following fuels were investigated: standard T-1 (TS-1), TS-1
purified by hydrotreating, TS-1 with high mercaptan content, and a T-2 (T-2)
type fuel from a wide fraction containing components of thermal cracking. ✓
The thermal stability and corrosive activity of the sulfur-containing fuels
were studied under static conditions in a bomb; and also when the fuel was pumped
through a filter and through an actual fuel system of a motor. It was
shown that of the fuels investigated, T-2 containing cracking components
and TS-1 with a high mercaptan content had the lowest thermal stability at
Card (1/2)

120°C. Pumping of these fuels at the temperature mentioned results in rapid clogging of the filter and is accompanied by the formation of a deposit on the fuel-utilizing components of the unit. TS-1 with a high content of mercaptans (0.032%) had the highest corrosive activity; T-2 had low corrosive activity. TS-1 purified by hydrotreating had the best thermal stability and insignificant corrosive activity. It was shown that hydrotreating during the production of fuels of the TS-1 type resulted in considerably higher thermal stability and in lowered corrosive activity of fuels obtained from Eastern petroleum. SOURCE: AN SSSR. Doklady, v. 163, no. 5, 1965, 1147-1150

TOPIC INDEX: stereospecific polymerization, polymer, butadiene, cobalt, catalyst

ABSTRACT: The object of the investigation was to enlarge the currently available information concerning the stereospecific catalytic activity of cobalt catalytic systems (B. S. Turov and P. A. Vinogradov 1 dr., DAN, 155, 874, 1965). The polymer studied was butadiene. The experimental results are shown graphically in Figs. 1 and 2 on the Enclosure. It is concluded that the addition of $AlCl_3$,

RAI_2 , Br_2 , H_2O , $CH_2 = CH - CH_2$ halogen, $RCl - Al - O - Al - RCl$ increases the formation of 1,4 cis rings, the molecular weight, and the rate of polymerization, whereas the addition of R_3Al , RSR , ROR , R_3N , KCl , and $NaCl$ decreases the number

of 1,2 rings, the molecular weight, and the rate of polymerisation. Orig. art.
has: 1 table, 3 graphs, and 3 equations.

TITLE: Influence of electron donor additives on the chain structure in stereospecific polymerization of butadiene

SOURCE: AN SSSR. Doklady, v. 151, no. 5, 1963, 1118-1119

TOPIC TAGS: electron donor, butadiene polymerization, stereospecific polymerization, cis-polybutadiene, trans-polybutadiene

ABSTRACT: The effect of thio-ethers and tertiary amines (dibutyl sulfide and triethylamine) on butadiene polymerization was studied as a continuation of earlier study by the authors (DAN, 146, 1141 (1962)) of the effect of straight ethers. These compounds had less effect on polymerization rate than the straight ethers. They did effect an increase in the amount of 1,4-trans isomer by decreasing the 1,4-cis-polybutadiene. There was no lowering of solubility or unsaturation in the polymer formed. Experiment shows the cis-polybutadiene does not

undergo changes in presence of donor additives and components of the catalyst system $TiI_4 + (iso-C_4H_9)_3Al$. Trans-members are formed only in the polymerization process by the direct participation of complexes containing the electron-donor additives. Orig. art. has: 1 figure.

TITLE: Effect of electron donor additives on the microstructure of the chain by stereospecific polymerization of butadiene in the presence of "cobaltic" catalytic systems.

SOURCE: AN SSSR. Doklady*, v. 155, no. 4, 1964, 874-875

TOPIC TAGS: butadiene, polymerization, polybutadiene, electron donor additive, chain microstructure, cobaltic catalyst system, stereospecific polymerization, dialkylsulfide, simple ether, tertiary amine, cobalt chloride ethanol complex, diisobutylaluminum chloride, polymerization rate, molecular weight

ABSTRACT: The effect of dialkylsulfides, simple ethers and tertiary amines on the microstructure of the chain formed by polymerizing butadiene in a catalytic system consisting of the $\text{CoCl}_2\text{-C}_2\text{H}_5\text{OH}$ complex and diisobutylaluminum chloride dissolved in a hydrocarbon was investigated. Experiments were run in benzene at 30C using 0.01 wt.% (based on monomer) of the CoCl_2 -catalyst. Microstructure

was determined quantitatively from IR spectra at 912 and 966 cm^{-1} . Introduction of dialkylsulfides into the polymerization system changes the structure of the polybutadiene: the 1,4-cis units decrease as the 1,2-units increase, while the amount of 1,4-trans linkages remains constant. Simple ethers and tertiary amines have a similar effect on the microstructure of the polybutadiene. All these additives in even small amounts (above 0.1 mol/mol of diisobutylaluminum chloride) rapidly decrease the rate of polymerization. The electron donors lower the molecular weight of the polymers. Thus, there is agreement between the change in the chain microstructure and the molecular weight of the polymer. Orig. art. has: 2 figures.
